Fridge: aka Freshie? Freshy? Freshly? HeyFridge?

Problem: college students and young adults struggle with best practices when it comes to grocery shopping responsibly and storing food correctly, resulting in X lbs. of food waste. Furthermore, incorrect food storage and lack of awareness can lead to undesirable food safety outcomes.

Solution: creating a web app that helps students keep what's in their fridge in mind in their day2day, reducing food waste, while providing incentives to compete against their friends and shop locally

Category: edtech, sustainability, food waste, food safety

Goals:

- **!!! -**
    - **Food spoilage tracker**
        - Receipt scan input method - scan receipt
        - **!! - need ability to input food manually as well**
        - Food expiry lookup - lookup SKUs from receipt in known databases, producing estimates for how long food should last
        - Food storage recommendations for "unknown / unlearned" foods
            - Anki/Duolingo expertise type-beat
    - **Food reminder system**
        - UI: swipe left/right if the food is still in your fridge / unfinished
            - ~~Q: how often do we ping? how do we not annoy the user while not missing out on expiration?~~

              - ping ~1 week, 3 days, 1 day before expiration? Rely on push for time-sensitive

              - only add a "swipe card" upon expiry (this is the only event that matters since we're tracking food waste), yes = used, no = unused, expired

              - todo list style for using up ingredients before expiration date for our feedback system pre-expiration/swipe card to reduce overloading user with prompts
        - Provide general hints for what fresh food should look/smell/taste/feel like
            - **Q: how to incorporate this UI wise**

              - second/compound swipe queue

              - since our expiry approximation is a low bound estimate, we expose the hint to allow the user to "extend" the spoilage date by 2 days

              - after swiping "no" on a "your item expired, did you use it" prompt, a secondary card swipe pops up to prompt "does your food look spoiled" → "yes, toss :(" OR "no, 1-2 more days to eat it!"
    - Food waste measurement system

        - Track when foods are/aren't used completely
            - ~~*Q: How do we do this in a nice UX way → Q1*~~
    - **Clean UI / demo-ready**
- !! -
    - Community tab (Beli type-beat) - leaderboard for food waste and cooking food responsibly
        - Game-ify tracking: streaks, $ wasted on food, lbs. of food wasted, etc.
    - Grocery List - write what you want to buy next
        - Personalized shopping recommendations (i.e. *last time you bought too much X, buy less to prevent waste!*)
    - Location-based recommendation system: ping you when you're eating out (*you have X food left!*) & at the grocery store (*what would go well that's left in your fridge)*
    - Takeout leftovers - management system
- ! -
    - External connections - grocery stores & farmers markets
        - Guided recommendation system based on subscription service
    - External connections - recipe recommendation system
        - MISE, recipe databases, etc.
        - Recommend recipes based on expiring items recency
    - Speech accessibility - TTS/STT
    - **Wrapped Waste**
    - Image-conditioned time-horizon prediction model for produce
        - Based on the color / condition of produce, the expiration date can vary
        - Training a basic prediction neural net can serve as a backbone for expiration date prediction

Needs:
- Frontend: react, vercel, next.js,
- Backend:
- DB: convex
